Course Overview

CA RC/Query[®] for DB2 for z/OS (CA RC/Query) is a comprehensive DB2 catalog management facility that helps you query, analyze, maintain and manage the DB2 subsystem. CA RC/Query generates reports and presents you with a cohesive view of your DB2 objects and their relationships in a variety of report formats. From any report, you can select a variety of options to generate more detailed information about such attributes as an object's relationship to other objects in the DB2 subsystem. You can also build new reports directly from the currently displayed information, drill down for more detail or move laterally for a broader view.

This course consists of a 15-minute recorded presentation designed to provide an introductory overview of the report customization, package list, and table list functions available in CA RC/Query.

This Course Will Show You How To:

- Customize reports by changing the user profile options.
- Print or save a report to a PDS member.
- Use package list commands to rebind one or more packages.
- Use table list commands to examine primary and foreign key relationships.
